

LatchDeck

The Collectibles Layer for Creator Relationships

Strategic Vision and Execution Plan

Prepared for: Livelatch

Scope: current engineering state, redemption and viewer-profile execution plan, architectural alternatives, market positioning, and campaign scenarios.

Status: internal planning document — synthesizes decided architecture, open designs in *docs/latchdeck/*, and new proposals introduced in this document.

One-line thesis

A link-in-bio profile is a list of exits. LatchDeck turns that same profile into a place a fan has a reason to come back to, because they own something there — and it only works as a moat if it is built and shipped as an independent, portable system that Livelatch merely renders, not a feature bolted to the Livelatch codebase.

1. Executive Summary

LatchDeck reframes what a creator profile is for. Every existing link-in-bio tool — Linktree, Beacons, Milkshake and the rest — competes on the same axis: more link types, prettier themes, better click analytics. All of them are, structurally, a list of exits: a fan clicks through and leaves. LatchDeck gives a fan a reason to come back that has nothing to do with clicking anywhere — they own a card, a trophy, a sticker pack, sitting on a page that is theirs.

That only becomes a durable advantage if it is built the right way. This document's central architectural argument, expanded in Section 3, is that LatchDeck must be developed and marketed as an **independent system that happens to integrate with Livelatch** — not a Livelatch feature. Encore already is the sole backend authority for LatchDeck data; Livelatch's job is to render cards and mint them through Studio, nothing more. That discipline is what lets a brand, a game studio, or another creator platform integrate with "an API and an SDK key" later, instead of with "Livelatch's card system."

Where things stand today: the creator-facing half of LatchDeck is live — Studio lets a creator design, draft and publish cards, gated by tier, with a working Encore API behind it. The viewer-facing half — redemption, ownership, and a fan's own collectible page — exists only as design documents. Four of them are already detailed and internally consistent (architecture, campaigns and mechanics, card identity and provenance, the rarity/value model). This plan does not re-litigate those decisions; it sequences them into buildable phases, stress-tests them against alternatives, and extends them to cover two things not yet speced anywhere: analytics/Latchalytics Pro, and brand or game-studio campaigns run across multiple creators at once.

Sections 2-5 are the execution plan proper: current state, target architecture, and a phased build-out for redemptions and the viewer profile page. Section 6 lays out alternative approaches worth weighing against the current plan, including two proposals that are genuinely new here (a sponsor-funded, many-creator campaign type; and locked single-use redeem links for high-value drops). Sections 7-9 make the commercial case — why this differentiates Livelatch from the rest of the link-in-bio category, concrete campaign scenarios across streamers, brands and game studios, and the named industry data those scenarios lean on. Section 10 closes with the risks and open questions that should be resolved before, not after, the campaigns schema is finalized.

2. Current State of Engineering

LatchDeck already runs on a four-system split: Encore (*Id/latchdeck*) is the sole API and writer; Supabase Postgres is the data store Encore connects to directly; Livelihood is one human-facing client; LatchOps is operator tooling for approving creator applications. Nothing except Encore touches the *latchdeck_** tables — that rule is already respected in what exists today, and the table below shows exactly how far "today" currently reaches.

Component	Status	Where it lives
Encore API (staging)	Live	Card CRUD, draft/publish, tier gating, creator applications and approval — <i>Id/latchdeck/latchdeck/*.ts</i>
Supabase schema	Live	<i>latchdeck_creators</i> , <i>latchdeck_applications</i> , <i>latchdeck_cards_mvp</i> , status history and restrictions tables
Studio editor (creator side)	Live	Card design, Unsplash art, effects — <i>LatchDeckController.php</i> , <i>LatchDeckService.php</i>
Public carousel block	Live — render only	<i>blocks/latchdeck/display.blade.php</i> ; deep links to <i>/redeem/{code}</i> and <i>/card/{id}</i> are already stubbed behind a <i>services.latchdeck.viewer_url</i> config value, showing "redemption coming soon" until it is set
Creator redemptions dashboard	Stub UI only, no backend	<i>redemptions.blade.php</i> renders "no redemptions yet" — the shell Latchalytics Pro would eventually fill
Redemption / claims engine	Not built — spec only	<i>campaigns-and-mechanics.md</i>
Card instance / ownership ledger	Not built — spec only	<i>card-identity-and-provenance.md</i>
Rarity / value scoring	Not built — spec only	<i>rarity-model.md</i>
Public viewer profile ("cabinet")	Not built — new repo does not exist	<i>publiclatchdeckpage.md</i>
LatchID identity	Live	Single Supabase-backed account; no separate creator/viewer identity; Pro/Free are additive roles synced automatically from Stripe billing
PostHog analytics	Live, client-side only	Autocapture + pageview/pageleave; one custom server-side event exists as precedent (<i>profile_link_clicked</i>); nothing LatchDeck-specific yet
LatchOps admin	Live	Approve / deny creator applications via Encore <i>/admin/*</i>

Two details worth carrying forward: redeem codes today are already creator-typed, human-readable strings (regex-validated in *LatchDeckController*, e.g. *STREAM-DROP-1*) rather than opaque generated tokens — this matches the "memorable code" model in the campaigns spec, so there is no gap to close there. And the public block already assumes a future viewer app exists; the only Livelihood-side work needed to "turn it on" once that app ships is setting one configuration value.

3. Target Architecture — an Integration, Not a Feature

The architecture already on paper gets this right; this section states the principle explicitly so it survives contact with deadline pressure. LatchDeck is not a Livelatch feature that happens to have an API. It is an independent product — a portable collectibles and identity layer — for which Livelatch is simply the first, and currently only, human-facing client. A future brand campaign tool, a game studio's SDK integration, or an entirely different creator platform should be able to plug into the same Encore API on the same terms Livelatch does today.

The test for every future PR

Could this exact change be deleted tomorrow, with Livelatch shut off entirely, and no viewer or creator would lose any data or capability they had? If the answer is no — if deleting Livelatch would strand a redemption, an ownership record, or an analytics rollup — the logic is in the wrong repo.

Livelatch's entire footprint in LatchDeck should stay limited to three things:

- **Studio (mint and manage)** — the creator-facing editor that already exists; it calls Encore, stores nothing of its own.
- **The public block (render)** — the carousel that displays cards on a profile; read-only, no redemption or ownership logic behind it.
- **One configuration pointer** — `services.latchdeck.viewer_url`, so the block knows where to send a fan to actually redeem or manage their collection.

Everything else — the redemption/claims engine, the ownership ledger, the rarity model, the fan's public cabinet, and (per Section 9) brand-campaign orchestration — lives outside the Livelatch codebase entirely, in Encore and the new viewer app. This is what makes the "sdk" tier reserved in the auth handler today a real future option rather than an aspiration: a third party never has to ask "how do we integrate with Livelatch," only "how do we call this API."

Client map — who talks to Encore, with what key, doing what:

Client	Auth	Access	Purpose
Livelatch Studio	Service key	Read/write	Mint, edit, draft/publish cards
Livelatch public block	Service key	Read only	Render cards on a profile
Viewer app (new repo)	Service key (public reads) + user session	Read + redeem	Show a fan's cabinet; call /redeem
Live-chat ingest worker	Service key, scoped actor	Write (claims only)	Post chat-triggered claims — isolated, disposable front end
LatchOps	Admin key	Read/write (admin)	Approve/deny creator applications
Future brand/SDK clients	Per-partner API key (sdk tier)	Scoped read/write	Run campaigns or verify ownership, never touching Livelatch

4. Execution Plan — Redemptions

The mechanics are already fully speced in campaigns-and-mechanics.md: six gateways (live chat, the Livelatch redeem block, the viewer portal, QR code, creator grant, SDK) all resolve to one grant engine on Encore. What follows sequences that spec into shippable phases, ordered by what unlocks the most value soonest with the least new risk.

Phase	Scope	Spec reference
0 — Foundation	Encore only: campaigns/claims schema, the /redeem endpoint and grant engine, atomic supply decrement, idempotency-key dedupe, per-identity dedupe. No gateway is wired yet.	campaigns-and-mechanics.md
1 — Resolved-identity gateways	Livelatch redeem block (logged-in user) plus a bare-bones viewer-portal redeem form, shipped before the full cabinet page exists. Fastest path to the emotional core: claim a card.	Gateways 2 and 3
2 — QR + public landing	QR gateway (an encoded URL into the same flow, cheap once Phase 1 exists) and wiring the Livelatch block's existing viewer_url stub plus /card/:id public landing pages.	Gateway 4
3 — Ownership and serials	card_instance / ownership_events ledger goes live; creator-grant gateway (trophies) ships; "#7 of 10" becomes real on the cabinet.	card-identity-and-provenance.md, gateway 5
4 — Deferred-identity gateways	Live-chat ingest worker (highest risk, most brittle — isolate so the official gateways keep working if it breaks) and conditional redemption via bot integrations (Mix It Up, Streamlabs, StreamElements).	Gateway 1, conditional redemption
5 — Trading and SDK	transfer_card() ships against the ownership ledger already designed for it day one; first external SDK keys issued.	card-identity-and-provenance.md, gateway 6

Phase 1 deliberately ships before the viewer app exists — a minimal, unstyled portal redeem form validates the whole Encore grant engine and gives creators something real before the front-end investment lands. Phase 4 is placed last on purpose: the live-chat gateway is explicitly the disposable, ToS-gray part of the system (see Section 6, Alternative 2, for a lower-risk substitute to consider before building it in-house at all).

5. Execution Plan — the Viewer Profile Page

Decided 2026-07-01: the viewer's public cabinet ships as a new Next.js application hosted on Railway — keeping it in the same operational home as the rest of the stack (MySQL, S3), while server-side rendering gives properly previewed links when a fan shares a card or trophy to Discord or a TikTok bio. It remains a thin client: no direct database access, everything through the Encore read/redeem API already sketched in publiclatchdeckpage.md.

Milestone	Scope
v0 — Read cabinet + link redeem	GET /public/collection/:id renders owned card designs, public trophies, unlocked packs; redeem via a shared link only. Ships once Phase 1 (Section 4) lands.
v1 — Serials + QR	Cabinet shows real "#n of supply" once the ownership ledger (Phase 3) exists; QR-code redemption wired in.
v2 — Sticker packs	Pack-level unlock UI, cards_redeemed:N threshold display, decoration on the fan's own page.
v3 — Trading UI	Front end for transfer_card() once Phase 5 ships; provenance history ("who held #0001 before me") becomes visible.

Identity is not a new build: a viewer logging into the cabinet to redeem or manage their collection is the exact same LatchID/Supabase session already used everywhere else — reused, not reimplemented. Viewing the cabinet itself stays public and unauthenticated, matching the "public to view, login to act" split already decided in the design doc.

6. Alternative Approaches Considered

None of these overturn the plan above; they are recorded so the trade-offs were made with eyes open, and so a future timeline crunch has a documented cheaper option instead of an improvised one.

1. Render the cabinet inside Livelatch instead of a new repo

Cheaper to ship first: one less stack, one less hosting bill, no second repo to stand up. Rejected as the default because it recouples Livelatch to redemption and ownership display exactly as tightly as if the logic itself lived there, undermining the entire "portable client" premise this plan is built on. Worth keeping on record as the fallback if the Next.js/Railway timeline slips badly.

2. Use existing stream bots instead of a bespoke chat-ingest worker

The spec's live-chat gateway assumes an in-house connector (e.g. an unofficial TikTok Live library), explicitly flagged there as ToS-gray and brittle. A lower-risk substitute: launch the chat-redemption mechanic through custom commands in StreamElements, Streamlabs, or Mix It Up, which already maintain the fragile chat-connection layer for thousands of creators. Trade-off is less control over latency and per-bot quirks, but it removes account-ban exposure entirely and ships sooner. Recommended as the default for Phase 4; keep the bespoke connector as a stretch goal only if bot integration proves too limited.

3. Locked, single-use redeem links for high-value drops

Today's model is a shared claim code anyone can redeem until the cap is hit — good for reach, bad for a genuinely scarce 1-of-1 that a scalper Discord could drain in seconds if the code leaks. Proposed addition: an optional per-campaign flag, `recipient_locked`, that instead issues signed single-use links to specific recipients. Most drops stay open by default; a creator opts a specific prestige drop into locked mode rather than the whole system being redesigned around it.

4. A distinct sponsor-funded, many-creator campaign type

Today's campaign model is single-creator. The brand scenarios in Section 8 need a campaign that spans many creators under one sponsor, which is not in the current schema sketch. Concretely: `latchdeck_campaigns` would need an optional `sponsor_id` distinct from `creator_id`, and a join table linking one campaign to several participating creators' card variants. This is exactly the kind of decision the project has already learned to make early: the trading ledger was added to the schema from day one specifically to avoid a painful migration later, and the sponsor/creator split deserves the same treatment before the campaigns table ships in Phase 0.

5. Route Encore analytics events through Livelatch instead of directly to PostHog

Encore is the sole writer of redemption events, so it needs its own path to PostHog for Latchalytics Pro data. One option: relay through Livelatch, reusing the one proven server-side pattern already in the codebase (`SupabaseProfileLinkClickService`), avoiding a new PostHog credential in Encore. Rejected as the default because a chat, QR, or SDK redemption never touches Livelatch at all, so there would be nothing to relay through for the gateways that matter most. Recommended instead: Encore holds its own PostHog ingestion key as an Encore secret, the same way it already holds its Supabase and admin-key secrets, and emits events directly using the `latchid:<uuid> distinct-id` scheme already in use.

7. Positioning — Beyond Link-in-Bio

Every incumbent link-in-bio tool competes on the same axis: more link types, prettier themes, better click analytics. Linktree alone reports 50 million-plus users as of May 2024, up 22% from December 2023 (TechCrunch, 2024), reached a \$1.7 billion valuation in 2022 on a \$152 million raise (TechCrunch/CNBC, 2022), and more recent reporting puts FY2024 revenue at roughly \$64 million, up 50% year over year (Sacra, 2025). Linktree alone is estimated to hold around 80% of the roughly 31 million Instagram link-in-bio user base, with Beacons a distant second at about 2.4% (influencers.club, 2025). The wider category is estimated at \$1.2 billion in 2025, projected toward \$3.2 billion by 2032 (Statistics MRC, 2025).

Every one of those numbers describes the same underlying product: a stateless list of outbound links with a click-analytics layer on top. There is no account, no ownership, nothing a fan keeps. LatchDeck breaks that axis on purpose — a fan does not click through a Livelatch profile, they hold something on it. Retrofitting that onto a Linktree-shaped product is not a feature flag; it requires exactly the "single trusted writer plus append-only provenance ledger plus real account identity" stack this project has already committed to (see the "minted, no web3" model in card-identity-and-provenance.md). That is a rebuild, not a roadmap item, for anyone trying to copy it after the fact.

The retention argument is not speculative. Antavo's 2025 Global Customer Loyalty Report finds gamification lifts customer engagement by up to 47% and that gamified loyalty programs see a 30% increase in retention; 93% of program owners who track ROI report positive returns, averaging 5.3x. Those are levers a click-and-list tool structurally cannot pull, because there is nothing in it to be loyal to.

Collectibles as a category are not a novelty bet, either. The Federal Reserve's own 2022 Survey of Consumer Finances found 18% of under-35 investors already own a collectible as an investment, up from 11% in 2019 — a rare government-sourced data point in this space. Separately, survey coverage from clct.com puts Gen Z and millennial interest in collectibles at 94%, and the collectible trading-card market itself is estimated at roughly \$13.8 billion in 2024, projected toward \$28.7 billion by 2033 (DataHorizon Research). This is a real, growing, largely non-crypto audience appetite LatchDeck is built to meet.

The deliberate "no web3" positioning is itself part of the pitch, not a hedge. DappRadar's tracking shows the art-NFT segment collapsed from about \$2.9 billion in 2021 to roughly \$23.8 million in the first quarter of 2025 — a peak-to-trough decline over 90% — as active traders fell from a 2022 peak of 529,101 to 76,176 in 2024. That collapse happened largely on trustlessness nobody asked a fan community for, and speculative pricing nobody wanted attached to a relationship with a creator. "Minted, no web3" gets the ownership and provenance feeling this audience already responded to in 2021, without the baggage that burned it once.

8. Campaign Playbook — Creators, Brands, Game Studios

A. Big creators (TikTok / Twitch streamers)

Live-drop mechanic during a stream: a chat command or on-screen QR code claims a capped-supply card, with a sell-out bonus feeding the rarity score once it fills. The audience behavior already exists — a TikTok/Ipsos study reported via Tubefilter (December 2025) found 68% of TikTok LIVE users have already tried gifting, and more than 60,000 U.S. creators earned more than median part-time monthly income from gifts in 2025 alone. LatchDeck slots directly beside a "the audience does something, gets something" behavior these creators already run every stream.

A reality check on scale, drawn from TwitchTracker's 2025/2026 figures: the median stream draws just 7.4 concurrent viewers, with more than 55% of streamers under five viewers, against roughly 2.17 million average concurrent viewers and 93,000 average concurrent channels platform-wide. The mechanic should be designed to feel special at six viewers, not just at the top of the platform — a 10-supply drop for a six-person stream is exactly the intimate, high-scarcity case the rarity model in `rarity-model.md` already rewards, since prestige there is fame-per-card, not raw follower count.

Pack completion across a week or month of streams turns attendance into "appointment viewing," per the packs design in `campaigns-and-mechanics.md` — and the discovery flywheel (Visibility Cards, a Pro feature) gives a creator a provable "X new viewers found you" pitch, aimed at a market where global influencer marketing spend already sits around \$32.55 billion in 2025 (Statista) — creators increasingly want provable discovery, not another vanity metric.

B. Brands

The genuinely new mechanic this plan proposes (Section 6, Alternative 4): one sponsor, many creators, one shared campaign. A beverage brand or a hardware peripheral company seeds a limited "brand x creator" card across ten creators' streams in the same week, each creator's version serialized or flavored differently, with a cross-creator completion reward (a merch code, a discount, early access) for fans who collect the full set across multiple creators. This gives influencer spend — already flowing to exactly these creators at roughly \$32.55 billion a year — a persistent, ownable artifact instead of a 24-hour story post, plus real redemption-count attribution a link-in-bio click-through cannot match.

Legal guardrails already flagged in the design docs apply directly here and should be treated as binding, not optional, once real money is involved: brand card packs must stay earned, never bought, to stay clear of loot-box regulation, and any brand tie to giveaway odds needs the same legal review `card-identity-and-provenance.md` already calls for before official trading-for-value is considered.

C. Game studios / SDK partners

The reserved sdk tier and the instance-metadata schema already sketched — attributes, rarity score, creator, edition, serial, deliberately ERC-721-shaped but centralized — exist for exactly this: a card minted on a streamer's channel becomes a real, ownership-verifiable in-game item. A studio partners with streamers ahead of a launch; redeeming a card during launch-week unlocks a cosmetic in-game on release. This mirrors what Twitch Drops already validate — audiences show up and stay tuned for redeemable in-game items — but gives the studio a durable, tradeable, provenance-tracked object instead of a one-time drop flag, and gives the streamer a collectible tied to their own name rather than a generic platform reward.

Longer term, because the ledger already models trading from day one, a studio-partnered card set doubles as a soft secondary-market layer without LatchDeck ever touching monetary value directly — keeping the CS:GO skins legal precedent firmly on the "watch, do not build yet" side of the line the provenance doc

already draws.

9. Industry Data Appendix

Collected in support of Sections 7 and 8. Confidence is flagged per row: **High** = a named, top-tier source (Statista, Goldman Sachs, DappRadar, Antavo, US Federal Reserve, or direct company/press disclosure); **Medium** = a credible third-party analytics tracker without official company confirmation; **Directional** = a smaller research shop or aggregator where methodology is less transparent — treat as illustrative of scale, not precise.

Topic	Stat	Source / Year	Confidence
Creator economy	Market ~\$250B today, ~\$480B projected by 2027 (10-20% CAGR)	Goldman Sachs Research, 2023	High
Link-in-bio: Linktree	50M+ users (May 2024, +22% vs Dec 2023); \$1.7B valuation (2022); ~\$64M FY2024 revenue, +50% YoY	TechCrunch 2022/2024; Sacra 2025	High
Link-in-bio: category	Category ~\$1.2B in 2025, projected ~\$3.2B by 2032 (14.4% CAGR); Linktree ~80% share of ~31M Instagram link-in-bio users, Beacons ~2.4%	Statistics MRC 2025; influencers.club 2025	Directional
Live-gifting: TikTok	68% of TikTok LIVE users have tried gifting; 60,000+ US creators earned more than median part-time income from gifts in 2025	TikTok/Ipsos study via Tubefilter, Dec 2025	High
Live-gifting: Twitch	Bits fixed at \$0.01 payout since 2016; 50/50 standard subscriber split (moving to 60/40-70/30 at higher tiers, 2026 terms). No solid aggregate Bits revenue figure found.	Twitch public monetization terms, 2026	Medium / gap flagged
Loyalty and gamification	Gamification lifts engagement up to 47%; gamified loyalty programs see 30% higher retention; 93% of programs tracking ROI report positive returns, averaging 5.3x	Antavo, Global Customer Loyalty Report 2025	High
Collectibles market	Trading-card market ~\$13.8B (2024), projected ~\$28.7B by 2033 (7.6% CAGR); sports cards ~\$13B (2024); Pokemon printed 11.9B cards FY2023-24	DataHorizon Research 2024/25; retailer press, 2025	Directional
Collectibles: investor behavior	18% of under-35 investors own a collectible as an investment (2022), up from 11% (2019); 94% of Gen Z/millennials report interest in collectibles	US Federal Reserve Survey of Consumer Finances, 2022; cllct.com, 2024/25	High (Fed figure)
NFT market trajectory	Market cap ~\$145B (2021) to ~\$40.3B (2023); art-NFT segment ~\$2.9B (2021) to ~\$23.8M (Q1 2025), 90%+ collapse; active traders 529,101 (2022 peak) to 76,176 (2024)	DappRadar, 2024/2025	High
Twitch scale reality	~2.17M average concurrent viewers, ~93,000 average concurrent channels; 11.4M monthly active streamers but only 2.4M weekly; median stream draws 7.4 concurrent viewers	TwitchTracker, 2025/2026	Medium
Influencer marketing spend	Global market ~\$32.55B in 2025 (up from ~\$1.7B in 2015); influencer ad spend forecast ~\$44.18B by 2025, ~\$80.61B by 2030 (12.78% CAGR)	Statista, 2025	High

Note on gaps: no authoritative aggregate figure for total global Twitch Bits/gifting revenue could be found and is flagged rather than estimated; creator-economy total size varies widely by research firm (Goldman Sachs is led with here as the

most reputable single figure); several link-in-bio and trading-card numbers come from smaller research shops rather than top-tier firms and are marked directional accordingly.

10. Risks, Open Questions and Roadmap

Open questions carried over from the design docs

- Privacy toggle — can a viewer hide their cabinet or specific items, or is it always fully public?
- Trophy revocation — can a creator rescind an awarded trophy, or is an award permanent like a card?
- Sticker placement — free-form decoration vs. fixed slots on the cabinet page?
- Redeem gating — should an optional account-age or follow gate ever apply to a claim code, or should it always stay open?

New risks surfaced by this plan

- The sponsor/creator campaign split (Section 6, Alternative 4) needs a decision before the campaigns table ships in Phase 0 — this is a schema decision with the same "avoid a painful migration later" stakes as the trading ledger already got right.
- Chat-ingest ToS exposure is real; Alternative 2 (existing stream bots) is the recommended default unless the in-house connector proves clearly necessary.
- Loot-box and gambling-adjacent legal exposure, already flagged for organic packs in card-identity-and-provenance.md, applies with more force once brand money is directly funding drops — route brand campaigns through the same legal review before scaling past a pilot.
- The rarity model's weights (wS, wP, wH, wC) are explicitly untuned placeholders; do not expose a numeric "value" score to end users until at least one real campaign's data has been used to sanity-check them.

Roadmap summary

Milestone	Scope	Reference
Phase 0	Encore redeem foundation	Section 4
Phase 1	Livelatch block + basic viewer portal redeem	Section 4
v0 viewer app	Read-only cabinet, Next.js on Railway	Section 5
Phase 2	QR gateway, public card landing pages	Section 4
v1 viewer app	Serials + QR redemption	Section 5
Phase 3	Ownership ledger, creator-grant trophies	Section 4
Phase 4	Chat ingest (or bot-based alternative), conditional redemption	Section 4/6
v2 viewer app	Sticker packs	Section 5
Phase 5	Trading, first external SDK keys	Section 4
v3 viewer app	Trading UI	Section 5
Parallel track	Latchalytics Pro: Encore-native PostHog events, free/pro stat split	Memory, Section 6

This plan intentionally sequences the emotionally load-bearing moment — a fan claiming a card — as early as Phase 1, ahead of ownership ledgers, trading, and brand tooling. Everything after that is depth on a proven core, not prerequisite for it.
